Technical Skills

Languages: TypeScript, JavaScript, Python, C/C++, Java, SQL, Bash

Frontend: React, Next.js 14 (App Router, Server Actions), Tailwind CSS, Recharts, shadcn/ui

Backend: Node.js, FastAPI, RESTful APIs, Celery (async task queues), AWS Lambda, API Gateway

AI & LLMs: OpenAI API (GPT-4o, text-embedding-3-small), Claude API, Vercel AI SDK, k-means clustering

Cloud & DevOps: AWS (EC2, S3, Lambda, API Gateway, IAM), Terraform (IaC), Vercel, Git, Linux

Databases: PostgreSQL, MySQL, Supabase, Prisma ORM

Experience

Envia

Oct 2025 – Jan 2026

Software Developer Intern

Vancouver, BC

- Co-designed and built a subscription enforcement backend for an MVP launch, integrating RevenueCat webhooks to handle the full entitlement lifecycle (trial, active, expired, billing-retry) across web clients.
- Co-built an event-driven AWS system (Lambda + API Gateway) that became the single source of truth for payroll access – enabling real-time entitlement enforcement with **zero production incidents** across all post-launch releases.
- Provisioned and managed cloud infrastructure using Terraform (IaC), maintaining reproducible dev and production environments and eliminating manual environment setup.

Headstarter AI

Jul 2024 – Sep 2024

Software Engineer Fellow

New York, NY (Remote)

- Shipped 3 production-ready AI web applications end-to-end within tight weekly deadlines in a competitive cohort of fellows, iterating on scope and features with minimal supervision.
- Built full-stack applications using Next.js, TypeScript, Firebase, and Clerk – integrating OpenAI APIs to deliver AI-powered features including real-time generation, authenticated user flows, and persistent storage.

Projects

ReviewLens | Next.js 14, TypeScript, OpenAI GPT-4o, Prisma, Supabase PostgreSQL, Recharts

[Live](#)

- Built a full-stack AI SaaS platform that ingests CSV product reviews and delivers structured sentiment analysis, competitor benchmarking, and trend detection – completing the full AI pipeline **end-to-end in under 30 seconds** per batch.
- Engineered a multi-stage OpenAI pipeline: `text-embedding-3-small` for vector similarity, k-means clustering implemented from scratch, and GPT-4o summarization – generating actionable business insights from unstructured review data across **20–50 real analyses** run to date.
- Designed a normalized PostgreSQL schema (Prisma ORM + Supabase) supporting multi-product analysis with relational integrity, shareable report links, and scalable ingestion of CSVs with **100+ reviews per upload**.

AutoDev | FastAPI, Celery, PostgreSQL, Next.js, OpenAI API, Git

[GitHub](#)

- Built an AI-powered automated code refactoring pipeline: users submit a repo, the system generates refactored code via LLM, validates it compiles and passes tests in a **generate→validate→retry loop**, then commits approved changes via AST-based git patching – no manual intervention required.
- Architected a fully async backend with FastAPI + Celery task queues to handle long-running AI refactor jobs without blocking, paired with a Next.js frontend for one-click review and approval before commit.
- Implemented AST-based patch application to guarantee structural validity of refactored diffs before git commit, eliminating malformed patches from entering version history.

Education

Langara College

Expected Dec 2026

Associate of Science – Computer Science

Vancouver, BC

- **Relevant Coursework:** Data Structures & Algorithms (C++), Discrete Mathematics, Database Systems, Unix Tools & Scripting
