Technical Skills

Languages: TypeScript, JavaScript, Python, C/C++, Java, SQL, Bash

Frontend: React, Next.js 14 (App Router, Server Actions), Tailwind CSS, Recharts, shadcn/ui

Backend: Node.js, FastAPI, RESTful APIs, Auth.js, Inngest, Celery (async task queues), AWS Lambda, API Gateway

AI & LLMs: OpenAI API (GPT-4o-mini, text-embedding-3-small), Claude API, Vercel AI SDK, k-means++ clustering

Cloud & DevOps: AWS (EC2, S3, Lambda, API Gateway, IAM), Terraform (IaC), Vercel, GitHub Actions, Git, Linux

Databases: PostgreSQL, MySQL, Supabase, Prisma ORM

Experience

Envia

Oct 2025 – Jan 2026

Software Developer Intern

Vancouver, BC

- Co-built subscription enforcement for MVP launch, integrating **RevenueCat webhooks** to model the full entitlement lifecycle (trial, active, expired, billing-retry) and gate paywall access across web clients.
- Designed an event-driven **AWS stack (Lambda + API Gateway)** as the system of record for entitlements—enabling real-time access enforcement with **zero production incidents** across all post-launch releases.
- Provisioned reproducible dev/prod infrastructure with **Terraform (IaC)** and validated end-to-end API flows in **Postman** before client integration—eliminating manual environment setup and pre-release integration defects.

Projects

ReviewLens | Next.js 14, TypeScript, OpenAI GPT-4o, Prisma, Supabase PostgreSQL, Recharts

[Live](#)

- Built and deployed a full-stack AI review analytics platform that ingests up to **500 reviews per upload** (CSV/paste) and returns themed sentiment reports with executive summaries in **<60s** per run on serverless infrastructure.
- Engineered a 3-stage OpenAI pipeline (text-embedding-3-small → k-means++ clustering → gpt-4o-mini summarization) with atomic job claiming, background execution (Inngest/waitUntil), and rate limiting—converting unstructured feedback into shareable insights at scale.
- Designed a production PostgreSQL schema (Prisma + Supabase) with auth, normalized review storage, password/expiry-gated share links, and PDF/CSV export—backed by typed APIs, **51 automated tests**, and GitHub Actions CI on every merge to main.

ProfessorMatch AI | Next.js 14, React, MUI, Node.js, SQLite, OpenAI, Pinecone, Vitest, GitHub Actions, Vercel

[Live](#)

- Built a Next.js 14 full-stack app with **41 statically generated professor profiles** and streaming gpt-4o-mini chat grounded in retrieved review context—driving profile → chat conversion via deep-linked prompts.
- Designed a **3-tier hybrid retrieval pipeline** (Pinecone vector search → in-memory semantic embeddings → keyword fallback) using text-embedding-3-small and cosine ranking—degrading gracefully without API keys so local dev and CI stay fully testable.
- Shipped production features (JWT auth, bcrypt + httpOnly cookies, SQLite analytics logging, IP rate limiting) with **27 automated tests** (23 unit + 4 E2E via Vitest/Playwright) and GitHub Actions CI on every deploy to Vercel.

AutoDev | FastAPI, Celery, PostgreSQL, Redis, Next.js, Claude API, GitHub API

[Live](#)

- Built an autonomous refactoring agent that clones GitHub repos, runs **4-tool static analysis** (Radon, Ruff, Bandit, AST), and generates Claude refactors through a **generate→validate→retry** loop (**3 attempts/issue**)—opening PRs only after **5 safety gates** pass (diff, signatures, lint, security, pytest).
- Architected a **6-service** async backend (FastAPI + Celery + PostgreSQL + Redis) handling **10-min** pipeline jobs without blocking HTTP; deployed on Railway + Vercel with API-key auth, rate limiting, Alembic migrations, and Celery task observability.
- Implemented AST-based code splicing and diff validation before git commit—preserving public function signatures and blocking unsafe imports; validated end-to-end on a live sandbox repo (**3 issues detected, 1 refactor validated, 1 PR opened**) with **35 automated tests** and CI (Ruff, pytest, ESLint, build).

Education

Langara College

Expected Dec 2026

Associate of Science — Computer Science

Vancouver, BC

- **Relevant Coursework:** Data Structures & Algorithms (C++), Discrete Mathematics, Database Systems, Unix Tools & Scripting
